C++ works on any operating system, however the libraries will be different and depending on the computer a person has they will need to look up which one works for their device. In order to install this language one should search up their specific operating system and the language to download the proper library. To code in this language I personally use an IDE called Visual Studio Code, however there are many others, I picked VSD because the IDE environment seemed to be easier on my eyes. Eclipse is another one I thought of using, and I might switch if I find difficulties with VSD. I did need to initiate a class in order to start coding. Single line comments begin with a //, and multi line comments begin with /* and end with */.
